

# DR. PORNOLOGIST GUIDE

*(aka copycat of Miranda Miner setup)*

*\*\*I've been following this guy since his stock market days and I can assure you the system really works. Since this is a copycat of his trading method, please do visit his YouTube channel. I learned all of this through his free/pub vids.*

*Also If you want to deep dive into much advance learnings, why not invest in knowledge? Enroll in his University. This may look like a marketing propaganda to you but I'm just stating a fact here. Mas gusto mo ba maliquidate muna bago matuto? Hindi na uso ang learn from your mistakes. You have to learn from others mistake.*

## **Disclaimer:**

***I'm not affiliated to Miranda Miner.***

Okay so let's start.

Hello everyone, you may refer on this guide if you really experience struggles in trading. We all do, but I wanted to make this easier for you and not complicate things. I'll assume some of you already know the basics of trading. So ill skip that part and move ahead to trading execution itself.

Let me start first with the indicators that I'm using but just a disclaimer I consider myself a traditional trader and this setup works best for me so if you're not this type of trader might as well consider a different method or indicators. Everyone's different, you just have to find what suits best for you.

## **INDICATORS:**

1. RSI
2. MACD
3. BB 50 .2
4. VOLUME

## TOOLS:

### 1. FIBONACCI RETRACEMENT TOOL

There are 2 factors you need to consider first before you enter a trade.

1. TREND (Bullish, Bearish, Sideways)

2. What type of trade do you want to execute

(Position trade, Swing trade, Intraday trade, Scalp trade)

I'm pretty sure you're asking yourself, does this fucking matter at all?

YES. IT FUCKING DOES.

The common error traders usually commit is whenever newbies or even experience trader, usually trade the candles itself rather than the TREND. Considering the volatility of the crypto space, you have to expect pumps and dumps in the market. So, trading the candles itself is not really sustainable in the long run. So technically speaking what you've gained yesterday could be what you'll lose today since you're just trading without a trajectory. You just go with the flow and do gamble trades.

*TRADING IS DIFFERENT FROM GAMBLING.*

*Trading only becomes gambling when you trade without a plan. Hehe. Sala sa init sala sa lamig.*

What you need to be trading is the TREND. Once you know the trajectory of the trend of your TA's, you'll have clear thoughts in mind and much stronger conviction where the candles will go.

Next factor to consider, what type of trader are you?

You have to know the type of trade you want to execute since each type of trade has a different timeframe to use and different strategy. You can't be executing a trade on intraday timeframe and doing your exits on scalping timeframe. See? You're probably nodding now and slowly realizing the errors in your trade. You might see red candles in lower time frame but green candles in higher time frame. So, my point here is you need to stick your ass to what type of trade do you want to execute. If you enter in 1hr you have to exit in 1hr. If you enter a scalping timeframe, you exit a scalping timeframe. OKEH OKEH?

Types of trade:

**POSITION** = usually takes months or a year.

**SWING**= days to weeks.

**INTRADAY**= hours.

**SCALPING**= 1,3,5,15 up to 30 mins.

Once you already know these factors, you may now start planning your trade.

FIRST STEP TO DO, KNOW THE TREND OF THE COIN.

I use Bollinger bands with 50 . 2 settings to check it,  
I'll head to Daily Timeframe and check if the candles are above BB that means we're bullish,  
if candles are below the Bollinger bands meaning we're bearish.

## BEARISH

## BULLISH

Once I already know the trend of the market ill start giving my bias on the market by prioritizing my trades that favors the market. Logically speaking, I don't want to enter a long position on a bearish market sentiment. Same thing with short position on a bullish market. See the difference? WOW GRAPE.

After determining the trend of the market, ill now head to 1hr since this is my comfort zone. As much as possible ill refrain from doing long's if the market sentiment in higher TF like 4h and Daily is bearish. Same thing with short positions, you don't want to ride the wave against the trend of the market. Ride the wave that favors the trend of the market. SEE?

Logically speaking, doon tayo sa mas mataas percentage of winning. Wag maasim di naman tayo whale lol.

Using 1hr TF, I'll zoom in sa latest price action ng coin.

Then plot my support and resistance here. It could be horizontal resistance, trend line resistance, you have to identify all of the scenarios that might occur.

Lets say I don't know yet where is this trajectory will go. I'll use my fibonacci tool to confirm if this is a valid bounce area. How do I determine the right levels where I can place my fib?

so eto na nga mga maamser.

Pag mag memeasure kayo ng fib at ang gusto mong hanapin ay pump youll start your fib from the latest wick above down below. Your Golden ratios would be .382 .5 .618, why do I mean by that? These areas are the potential tp areas that you could mark since these are considered as traders quotient. They respect these areas especially the .618.

Opposite thing sa Bounce area, Pag bounce ang hinahanap mo sa isang coin youll start your fib below pataas, depending on what swing are you trying to measure. It could be higher swing, or lower swing.

For instance, Hindi ko pa alam ang candle na to na bababa dyan. Pano ko ipredict na dyan bababa yan? So ill make a higher swing fib from below to above

I'll mark these as my tp areas, kung mabasag yan golden ratios pababa. May tendency na mas bumaba pa ang coin. So ayun nga bumaba ang coin.

Pag ka baba ng coin pano ko nakuha yung ilalim? I used micro fib. Pero pano yun doc?

Microfib, Kukunin mo yung .618 area tapos yung 1.618 nayan = pag gumawa ka nyan disregard mo yung tinuro ko sa taas kung san mag sisimula ng pag plot nyan kasi diba sinabi ko pag pump hahanapin simula sa taas pababa. Pag naman bounce hahanapin simula sa baba pataas. Sa microfib there's an exemption. Pedeng pababa pedeng pataas kung ano mas beneficial sayo yun ang mas okay.

To give it a clearer context this is what I did. Kinuha ko yung fib ng .618 at 1.618 since gusto ko makuha yung ilalim, pero Nakita ko yung .618 na result is BASAG NARIN.

So ano ginawa ko? rineverse ko yung microfib. Nag simula ako sa ilalim pataas naman.

Ask yourself? Valid bounce ba to? Nasa golden pocket baa ko? May volume ba? May confluences ba ko? Pogi ba ko? Hehe jk. ODIBA MAGIC. WOW GRAPE.

Ngayon Nakita ko pwede itong maging potential bounce area ni btc, lets assume hindi ko pa alam na mag pupump yan.

Ang ginawa ko, kinuha ko ang fib levels nitong swing na to para malaman ko kung san paakyat ang price. Since cinoconsider ko yung support na tinatapakan ko na nakuha ko from using microfib is a valid bounce area, lumalakas conviction ko na possible mag bounce talaga.

So like what I've said kanina, pag pump ang kukunin san mag sisimula?  
Sa taas, pababa.

Ano nangyari? Edi yaman mo na nyan mars. TP HIT LAHAT HEKHEK.

Pero paano mo nalaman na dapat pasukin yang trade nayan? Hindi mo ba inexpect na possible basagin din pababa yung nakuha mo na microfib kanina?

This is where your oscillators will come in.

Ano ba ang oscillators?

these indicators are use to determine the momentum of the coin.

Yang rsi, macd, volume. Importante lahat yan so dapat alam mo yan gamitin bago ka mag futures.

Pag ang coin galing sa oversold territory technically using 1hr tf Lagi naman yan bubulusok pataas ng 50 rsi. Meron mga Traders na ganiyan lang ang gamit RSI traders pero syempre no assurance na bababa yung price. There are instances na ang rsi ay overbought state pero nag short ka kasi alam mo bababa na pero ang nangyari nag consolidate lang price action pero bumaba yung rsi. So pano na short pos mo expecting na bababa pa yung price. Edi bye bye.

That's why pag gagamit ng rsi maganda combine combine mo na sa ibang indicators, pangit ang adobo pag walang laurel leaves, toyo, suka. HEHEHE

so dito makikita mo malapit na tayo sa oversold territory, which is 30. Ano bang sabi ko? pag ang coin malapit na sa 30 rsi at or sumobra pa ng rsi 30. Ang coin babalik at babalik yan sa rsi 50.

Oh anong nangyari mga maamser. MAGICCCCCCCCCC MAMACITA SO THIC.

So +1 confluence ko na iyan na possible mag bounce sa area nayan so ginawa ko, Check ako ng isa pang confluence.

Dito papasok si MACD. Ano ba si macd? Moving average convergence divergence. So dito ginagawa ko nag hahanap ako ng divergence/convergence by doing a parallel lines sa rsi and macd.

Pag ang coin, may convergence = bullish or divergence = bearish, Mas mataas ang chances of winning mo. OKEH OKEH?

Pero doc pano ba imeasure yan?

before we head there, let me give you a clear context what is convergence and divergence.

Bullish convergence= Increasing price and decreasing oscillators (rsi, macd)

Minemeasure ang bullish convergence sa ilalim ng candles pati sa ilalim ng oscillators and parallel sila sa isat isa. OKEH OKEH?

Bearish divergence = Decreasing price and increasing oscillators (rsi, macd)

Minemeasure ito sa ibabaw ng candles pati sa ibabaw ng oscillators. OKEH OKEH?

Para hindi kayo malito, isipin nyo na mga Bundok yan or etits. Ipag coconnect mo yung dalawang etits or bundok.

FOR INSTANCE.

Paano ko ba napredict to na mag pupump to?

nag pump tayo dito ng 18% Syempre dahil sa bullish convergence.

Again, decreasing price candles sa ilalim plus increasing oscillators sa ilalim.

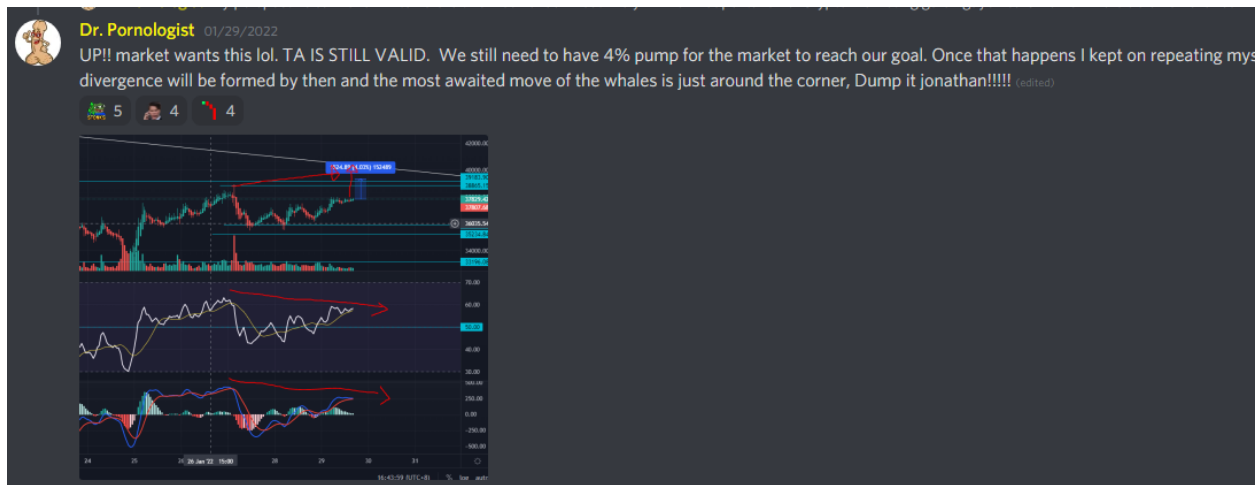

AND VOILAA!! HADUKEN!!!

DECREASING PRICE, INCREASING OSCILLATORS. (sa baba ng candles minemeasure pati oscillators)

EH ETO PANO KO NA PREDICT BABABA?

VOILAAAA!!!! HADUKEN!!!

Increasing price, Decreasing oscillators. (sa taas minemeasure ng candles and oscillators)

Pag pinag sama sama mo yang mga confluences nayan plus samahan mo ng proper application of fib tool plus volume. I don't think hindi mo mapredict ang galaw ng isang coin, Unless it's a crash. Take note, Di ko sinasabi na 100% lagging ganito, whenever you'll enter a trade lagi mo na agad contrahin paano kung bumaba? Paano kung ta invalidated? PLANNING COMES IN.

edi set ka stop loss sa ilalim ng resistance, Pag bumomba yung coin EDI ADJUST MO SA ENTRY PRICE STOP LOSS. Kung matalo Kaman edi breakeven. ASUS, always remember kung di ka willing mawala yung pera mo na pinasok, magugulo ang decision making mo sa buhay hahaha. Sala sa init sala sa lamig.

Now going back sa recent chart natin kay btc.

Confluences ko,

1. RSI oversold +1
2. Bounce on .618 microfib +1
3. Volume = above average volume. +1

ops teka Pano ba masabi na maganda ang volume?

Edi kunin mo average drawing ka ng line, pag lumagpas sa line smile ka na. HEHE

yun lang ba ang Teknik? Wala na ba dapat ako tignan, syempre meron pa papi.

Check mo rin yung macd kung nag coconfirm sa trend na gusto mo mangyari.

## HOW TO CHECK MACD KUNG NAG COCONFIRM?

Pag sinabing macd confirmation ni macd, ang dapat mong gawin or icheck if nag bullish cross ba ang macd or not. Pag bullish cross, si macdline ccross pataas kay signal line. Blue crossing red. Upwards trajectory.

Pag Bearish cross naman, Macd line ccross kay pababa kay signal line. Blue crossing red downwards trajectory.

In our case nag confirm ba ang macd?

YES OPO DOC PASOK NA KO HA.

NOPE NOPE NOPE. Bakit satingin mo di ko pa papasukin yan?

Check the volume kaibigan.

Sapat ba ang volume to support my bullish perspective? Kulang diba supot.

So di ako dyan pumasok, saan ka papasok doc? PAG MAAYOS VOLUME.  
oh anong nangyari bakit nag dump?

ALAM MO NAYAN KAPATEEEED.

San ako pumasok, syempre dun sa gusto kong volume hekhek.  
tanong green pa ba ang macd at hindi light green? YES so check. May volume ba? CHECK. EDI  
PASOK MARS.

SAN ANG TP KO? NAG PLOT KA NG FIB KANINA DIBA?  
ang tp zone mo .382 .5 .618. O EDI HAPPY HAPPY NA TAYO.

Going back to our confluences.

Confluences why I entered:

1. RSI oversold +1
2. Bounce on .618 microfib +1
3. Volume = above average volume. +1
4. Macd confirmation.

Eto lang finafollow ko mapa bearish mapabullish market, you can easily predict the trend where are we heading. Nakasurvive ako sa bearish, and bullish market using this system. Sana matutunan mo.

Excuse my words, I wanted to make it simple and entertaining kasi baka antukin kayo.

I hope you appreciate the small things. You can criticize the indicators im using, and it is totally fine. I just wanted to show you that trading isn't complicated, you don't need to use complicated indicators para kumita. Take note tatlo lang ata pede gamitin sa trading view, so swaklong swakto eto for you. I'm not saying na di effective yung mga yon ha? You just have to find what style suits you in your trading.

Madami pa ko gusting ishare, but I don't support piracy.

Go enroll in his University. Mas marami kayong matututunan sa kanya kaysa sa kin.
